Comments:

25X1

- The data in this report has been slightly rearranged in order to (a) facilitate comparisons between the original 1953 Plan and the modified one of July 1953, and to (b) throw into greater relief the actual production figures and enable the amounts retained in the works for further processing to be calculated more easily. The term "distributed" has been substituted for "sold" as the latter is possibly misleading. Some, and in certain cases most, of the production shown under the column entitled "Distributed" has been sold for export, but all the remainder is distributed within East Germany, either to other plants as raw material or to one of the distributing agencies.
- The changes in the 1953 Plan after June do not on the whole appear to be remarkable except as regards tricresylphosphate, foundry aluminum and one or two of the ferro alloys. It is worth noting that the production of purest aluminum, red phosphorus, and titanium dioxide are all well ahead of schedule.

25X1

3. The original planned production of 1,200 tons of ferrochromium represented the full capacity of the plant erected in 1952, but because of a reduced demand the plan was revised to 850 tons. Reserves are available.
4. This metal is at present being produced in a provisional plant; the new aluminothermic plant for the production of both ferromolybdenum and ferrotitanium will go into operation on 20 November 1953, and will have an annual capacity of 400 tons ferromolybdenum and 150 tons ferrotitanium. It is unlikely that the plant will be used to full capacity owing to a reduction in the demand for these metals. The 1953 plan was drastically reduced after 25 June 1953, on this account.
5. See Comment 4. Some of this metal was produced in the chemical department, but is entered here for convenience of reference.
6. This metal is at present produced in the electric furnaces of the steel casting department. A new plant in the metal department with an annual production capacity of 600 tons ferrotungsten was planned in 1952 and construction was started. Work on this was stopped in July 1953, however, and it is now doubtful if it will be completed. There are large reserves of the metal on hand.
7. Production has so far been carried on in the same plant as that used for ferrotungsten and was to have been transferred to the new plant, which was to have had an annual capacity of 60 tons ferrovanadium.
8. Anti-pest powder and solution.
9. Anti-pest chemical based on benzylene chloride.
10. Dissolving salt for aluminum and magnesium alloys.
11. Thawing salt.
12. De-foaming chemical.
13. Washing powders on a silicate base.
